

Supplementary Fig 1: Inflammatory scores of pancreas tissues in CDE-fed mice after 18 weeks of CDE diet; Means and standard deviations shown. CDE-fed mice receiving untreated water for 18 weeks (CDE/Reg; Blue) had significant pancreatic inflammation. After 12 weeks of CDE/REG water the 2nd cohort of mice were treated with proglumide-supplemented water for 6 weeks while continuing a CDE diet (CDE/Recovery; Red). Pancreata at week 18 of the proglumide recovery-CDE fed mice showed decreased inflammatory scores, ($p=0.036$)
